PRAVNO OBVESTILO:

Na vseh dogodkih projekta oooZnanost! poteka snemanje in fotografiranje za namen promocije in poročanja o dogodkih. Če vstopite na lokacijo (spletnega) dogodka, boste lahko posneti in fotografirani. Z vstopom na to lokacijo, dajete dovoljenje organizatorjem in Evropski komisiji, da vas lahko snemajo, fotografirajo, zvočno snemajo in uporabijo vaše posnetke po lastni presoji. Obiskovalci zato ne boste uveljavljali nobene odgovornosti proti organizatorjem in Evropski komisiji v zvezi z zgoraj navedenim.

V kolikor se z zgoraj navedenim ne strinjate, vljudno prosimo, da s tem seznanimate organizatorje na: ern@um.si. E-sporočilu obvezno priložite visokokakovostni sken fotografije z osebnega dokumenta, da vas lahko organizator izloči iz vseh posnetkov in fotografij skupaj z navedbo, na kateri lokaciji in katerega dne bi lahko bili posneti s strani organizatorjev. Pooblaščen oseb za varstvo podatkov Univerze v Mariboru je izr. prof. dr. Miha Dvojmoč (dpo@um.si).

Preplavljanje informacijskega prostora

Včasih želijo ljudje z dezinformacijami sejati zmedo in dvom. Družbena omrežja preplavljajo s številnimi in nasprotujočimi si različicami istega dogodka. Njihov cilj pri tem ni prepričevanje za neko stališče, ampak želijo z njimi spodbuditi splošno nezaupanje in apatijo. Oglejte si ta video s strokovnjakinjo Evropskega parlamenta, da izveste, kako zaznate tako grožnjo in se spopadete z njo.

Izkoriščanje čustvenega odziva

Ali ste že kdaj na družbenih omrežjih prebrali objavo, zaradi katere ste se razjezili ali užalostili? Ali pa se je zdela preveč dobra, da bi lahko bila resnična? Ali ste se ob njej takoj vprašali, ali je resnična? Ljudje, ki objavljajo dezinformacije, izkoriščajo močne čustvene odzive, prek katerih manipulirajo z nami in razširjajo svoje sporočilo. Ekipa Evropskega parlamenta za komuniciranje vam pomaga pri lažjem razumevanju, kako taki ljudje počnejo to in kako se lahko izognete, da bi se ujeli v njihovo zanko.

Mini Review

Cyllage City COVID-19 Outbreak Linked to Zubat Consumption

Utsugi Elm¹, Nasu Joy^{2*}, Gregory House³ and Mattan Schlomi^{2*}

*Corresponding author: Mattan Schlomi, Department of Infectious Diseases, Gotham General Hospital, Wooster, NZ 90210, United States.

Abstract

A localized outbreak of COVID-19 pneumonia in Cyllage City among a population with no history of travel to infected regions has been tentatively linked to consumption of the regional insectivorous zubat (*Vespertilio coeruleus sineculus*, Pseudochiroptera), supported by amino acid sequence similarity between SARS-CoV-2 and a related coronavirus from the bats. An increased need for surveillance of bat viruses in Kalos is warranted.

Review

Coronavirus disease 2019 (Covid-19) is caused by a virus of the Coronavirus family, SARS-CoV-2 [1]. The outbreak began in the city of Wuhan, China, and has since spread to every inhabited continent, with over 100000 cases and a climbing death toll [2]. Identifying the origin of the virus has proven difficult, in part due to misinformation associated with video of a Chinese travel blogger eating bat soup in Palau falsely attributed to the seafood market in Wuhan at the epicenter of the outbreak [3]. Molecular evidence has tentatively traced the origins of the virus to wild vertebrates including snakes [4-7], pangolins [8-11], pikas [12], sentrets [13-15], and kappas [16]. The former two are the most likely animal consumed in Wuhan that sparked the zoonotic event in Patient Zero [2,7-8].

However, most comparative virological evidence to date places SARS-CoV-2's origin within the bats: this evidence includes analysis of the RNA sequence of the virus' genetic material [17-20], amino acid sequencing of the capsid proteins [21-24], and fatty acid analysis of the lipid envelope [25]. This finding is similar to that of SARS-CoV-1, which was linked to consumption of a masked palm

ly related to that of horseshoe bats (genus *Rhinolophus*) [26,27]. Both bats and civets were in close contact with each other in the market where the SARS outbreak began and could have transmitted the virus amongst each other there, but another possibility is that the civets had been infected with the bat virus beforehand [28]. Bats are known to harbor many viruses and are the origin of several zoonotic diseases, such as Nipah virus and Ebola [26,29-30], so virologists are not surprised that SARS-CoV-2 appears to have originated in bats.

Most outbreaks of COVID-19 outside China have been traced to travellers from Wuhan or those who came in contact with them [31-33], and community spreading of the virus has been confirmed [34,35]. To this literature we add a report from Cyllage City in the Kalos region, France, where an outbreak of the densely populated metropolis has to date produced 420 confirmed infections with seven deaths, all in the elderly and those with pre-existing conditions [36-38], matching the widely reported 2% fatality estimates for COVID-19 [2]. The outbreak is remarkable as no residents are known to have travelled to infected areas in recent months: how-

Figure 1: Nucleoprotein Sequence Comparisons of SARS-CoV-2 and Zubat Viruses

This finding, while interesting, does not confirm that zubat is the source of the COVID-19 outbreak in Cyllage City, as the bats could have been infected from humans passing through the pedestrian-friendly cave, or the sequence similarity could be a coincidence [18,26]. Zubat is widespread from Western Europe to East Asia, but no data on their virology from this region exists. The striking nature of the COVID-19 outbreak exemplifies the need for further study on viruses in wild animals, and a moratorium on their consumption (as if conservation needs did not already place such requirements). Residents of Kalos attempting to explore the cave networks have since been required to submit to fever monitoring and hand-washing at the entrances to the cave. The Cyllage City outbreak has been successfully contained, though residents reports stores selling out of Repel® spray after it was stated to keep zubats away from spelunkers.

Experiential Learning in Secondary Education Chemistry Courses: A Significant Life Experiences Framework*

Bradley C. Allf
North Carolina State University, Raleigh, USA
Jesse B. Pinkman, Walter H. White
J. P. Wynne High School, Albuquerque, USA

Significant life experiences (SLE), a framework first put forward by Thomas Tanner, is a well-known model for understanding attitudes and perceptions about the environment as ascertained through environmental education (EE) programs. The SLE framework posits that early positive experiences in the environment are strongly correlated with later pro-environmental attitudes and behaviors in adulthood. According to the model, these early experiences facilitate this change through “experiential” learning, as opposed to formal learning experiences in a classroom, or even informal learning. While the SLE framework is often used within the EE literature, it is rarely used to model behavior and learning in the classroom setting. Here, we present a new use of the theory to model experiential learning in a high school chemistry course. We present evidence that a new model of SLE being used experimentally by faculty at a high school in New Mexico has led to significant learning gains among students. Specifically, we find evidence that low-achieving students may particularly benefit from this new model of teaching chemistry in the secondary education setting through the “hands-on” process of manufacturing and distributing methamphetamine (*N*-methyl amphetamine). While this study cohort is small, the authors believe that the findings presented herein may demonstrate the value of SLE and experiential learning within the broader science, technology, engineering, and math (STEM) education field (theory) and pedagogy (practice).

Keywords: secondary education, significant life experiences, STEM learning, chemistry education

Table 1
Sample Questions Used in Learning Outcome Evaluation

Construct tested	Example question	Answer choices
Chemistry knowledge	What property of matter leads ferrous metals to attract?	A. Mass B. Energy C. Magnets D. Gravity
Business knowledge	A dime of crystal sells for how much?	A. 12 fat stacks. B. 16 quantities of mad dough. C. None of your business this is my own private domicile.
Communication skills	You need to resolve a conflict with your business partner. What might be some effective strategies for negotiation?	A. Try coin flip. Coin flip is sacred. B. Hire a criminal lawyer. C. Wait for the cancer to come back.

Note. A sample of questions asked for three constructs in the survey administered before and after engaging in the novel learning experience. Bolded answer choices are the correct answers for these questions. Each construct made use of four items, each. Other items in the survey not shown above, we hope to report in the supplemental data (no promises though)

Results

Evaluations were binned into two groups: pre-Gus and post-Gus the statistical background or motivation to conduct more robust and refers to an incident where instructional technique shifted from synthesis (of explosives) to accomplish a real-world task (assassin pedagogical watershed moment for the advancement of the learning chosen.

Discussion and Conclusion

Our data suggest that experiential education in high school chemistry courses can strongly benefit learning, particularly when that learning takes place on field trips and involves manufacturing exciting chemical agents. Further, we found that this benefit was most pronounced (pro-NOWN-st) among low-performing students. These substantial gains made in science learning and real-world skills among students in the experimental group support the long-held idea that experiential learning may benefit student learning (Klauber, 1956; Kardong, 1980; Brodie & Jr. Brodie, 2004). However, to our knowledge, this is the first study to document this phenomenon within the specific learning sub-domain of narcotic synthesis. Moreover, because most known cases of experiential learning involve classroom learning, our study adds to the value of field trips (for other examples of the value of field trips, see Gans, 1961; Rowe et al., 1986; Barber & Conner, 2007; Aubret & Mangin, 2014; Brejcha, 2019; Vaughan et al., 2019).

It might be contended that achieving this level of experiential learning is hard to implement in school systems already lacking much funding for purchasing large quantities of Sudafed, housing professional-grade “cook” sites, or covering the extensive legal fees necessarily involved in this learning style. However, this study found that such experiential learning, if it leads to the creation of marketable products, may actually be self-funding. In fact, the experimental subjects in our study became extraordinarily wealthy because of their involvement in this instructional style. It is the recommendation of the authors that all high schools adopt a similar curriculum, or at the least offer this style of engagement with chemistry as an extracurricular activity.

False

[About this rating?](#)

A feel-good story about Travis Kelce, the Kansas City Chiefs' star tight end and singer Taylor Swift's fiancé, spread across Facebook in September 2025. According to various posts, Kelce donated "his entire \$12.9 million in bonuses and endorsements" to a charity organization, the Homeless Housing Initiative, to fund the construction of 150 homes and 300 beds.

The claim was shared in identical Facebook posts with [over 100,000 reactions](#)

The story described in the posts, however, was not real, much like a similar story about Kelce that spread across the internet in March.

A [Google search \(archived\)](#) for the statement Kelce supposedly said at a press conference returned no results, except for other social media posts sharing the exact claim. Press conferences usually generate news coverage, so it's unlikely Kelce would've said this at a press conference and no one report on it.

The "Homeless Housing Initiative" did not appear to be a real organization. A search for the organization on [Charity Navigator \(archived\)](#) returned no results.

Kelce also makes far more than \$12.9 million from endorsements alone. [Forbes reported](#) in August 2025 that Kelce and his brother signed a three-year, \$100 million contract with Wondery for their podcast "New Heights" in 2024. [Forbes \(archived\)](#) said Kelce was making \$30 million in endorsements in 2025.

A nearly identical story about Cincinnati Bengals quarterback Joe Burrow received over 20,000 times on [Facebook \(archived\)](#) in August. That story claimed Burrow funded 150 housing units and 300 beds, exactly as many as the later posts claimed Kelce was funding.

In March 2025, Kelce was the subject of [another made-up story](#) about the star donating homes to the homeless. Kelce addressed it on the April 9, 2025, episode of his podcast, beginning [around the 1:14:34 mark](#). "This time I wasn't doing what was falsely claimed by the social channels or the outlets posting all this AI stuff," Kelce said after promoting his real charity initiative, the [Eighty-Seven and Running Foundation](#).

These stories all very much resembled [glurge](#), which [Dictionary.com](#) defines as "stories, often sent by email, that are supposed to be true and uplifting, but that are often fabricated and sentimental."

Real stories of NFL players contributing homes to organizations fighting homelessness do exist. In August, retired NFL player [Jordan Jenkins](#) bought [two duplexes with four units in total](#), with at least two bedrooms per duplex, and [donated them](#) to [The Plummer Home](#) to house homeless veterans. Retired star Warrick Dunn [frequently donates homes to families](#) through his own charity foundation, as well.

Snopes has fact-checked a [number of glurge stories](#), including [about Kelce](#).

Authentic
picture from
White House?

FALSE

AFP

<https://factcheck.afp.com/doc.afp.com.69VD6G3>

The image spread quickly across platforms in [English](#), [Greek](#), [Serbian](#), [Slovak](#), [Polish](#), [German](#), [French](#) and [Portuguese](#).

It gained traction as European leaders joined Ukrainian President Volodymyr Zelensky at the White House for [talks with](#) Donald Trump following the US president's summit with Russian President Vladimir Putin [in Alaska](#).

[Trump said](#) he plans to hold a three-way meeting with the Ukrainian leader and Russian president.

Trump did meet with Zelensky in the Oval Office prior to discussions in the East Room that included the leaders of Britain, France, Germany, Italy, Finland, the European Commission and NATO, but there is no indication the image of individuals waiting in a hallway was taken at the White House.

A keyword search on X revealed a [higher resolution](#) version of the image was posted by other accounts, making it easier to spot signs it is inauthentic ([archived here](#)). Despite rapid advances in artificial intelligence, visual errors occur and careful examination of an image is a [key tool](#) for determining authenticity.

Next to the man who resembles French President Emmanuel Macron there is a third leg wearing black pants and a black high heel. There are also additional shoes next to the woman in red's feet.

The pattern of the carpet is inconsistent with a blue rectangle appearing in only one place and some segments appearing yellow where others do not.

Screenshot taken August 18, 2025 of the image shared on X with inconsistencies outlined by AFP
